Supplemental Information

SUPPLEMENTAL VIDEO 1
Apical 4-chamber view of transthoracic echocardiogram reveals akinesia of the left ventricular apex with normal function of the basal and mid-wall segments.

SUPPLEMENTAL VIDEO 2
Apical 2-chamber view of transthoracic echocardiogram reveals akinesia of the left ventricular apex with normal function of the basal and mid-wall segments.

SUPPLEMENTAL VIDEO 3
Left coronary artery angiogram reveals the left main coronary artery and branching pattern is normal. There is a well-organized filling defect in the distal ramus branch of the left coronary artery, where the vessel measures ~1.3 mm. There is flow visualized around the filling defect. Additionally, the distal left anterior descending (LAD) coronary artery terminates abruptly, suggesting distal occlusive thrombus.
