## **Supplemental Information**

## SUPPLEMENTAL TABLE 1 All Plan-Do-Study-Act (PDSA) Tests Completed

| Standardizing Clinic Workflow |  |   |  |
|-------------------------------|--|---|--|
|                               | Test   | Result  | Action   |
| PDSA                          |  |   |  |
| PDSA 1-2                      | Compared NM3 and downloaded ventilator data in 1 d and then 1 wk.                                | Downloads had reliable Vte values to dictate alarm use  | Adapted use of ventilator downloads for alarm decisions.   |
| PDSA 3-4                      | Attempted to collect downloads early in visit in 1 d and then 1 wk.                              | Better data but less efficient and some patients did not have home vent                                       | Adopted obtaining downloads at start of visit. Adapted to attempt downloads through DME.               |
| PDSA 5-6                      | Attempted obtaining downloads 1 wk in<br>advance through DME with revised<br>contact strategies. | Difficulties obtaining timely, readable downloads in advance.   | Abandoned downloads through DME.   |
| Use of alarm                  | algorithm  |   |  |
| PDSA 1-2                      | Used algorithm for 1 patient, then 1 d, then 2 wk.   | Well received by clinic RTs with multiple additional alarms set.  | Adopted use of algorithm.  |
| PDSA 3                        | Called patients after clinic to assess alarm changes.  | 2 alarms reverted back. Calls became very lengthy with topics unrelated to alarms.                            | Acceptable algorithm performance.  Abandoned regular calls to assess alarms due to increased workload. |
| Revised algor                 | ithm   |   |  |
| PDSA 1                        | Apnea alarm simulations.   | Effective for low tidal volume patients in simulation.  | Adapted trial to inpatients.   |
| PDSA 2                        | Turned on apnea alarm in 15 patients on the inpatient unit.                                      | 9 alarms were turned off by bedside RTs,<br>documentation on rationale was<br>incomplete.                     | Adapted with education of inpatient RTs and improved documentation.                                    |
| PDSA 3                        | Turned on apnea alarm in 15 patients on the inpatient unit.                                      | 5 alarms were turned off. Success with patients who had low mandatory breath rate.                            | Adapted algorithm to set apnea alarm for patients with low mandatory breath rates.                     |
| PDSA 4                        | Trialed revised algorithm in clinic for 1 wk.  | Able to set apnea alarm in a small number of patients.  | Adopted revised algorithm.   |
| Staff engagem                 | nent and sustainability  |   |  |
| PDSA 1                        | Add alarm settings to ventilator registry for weekly review.                                     | Alarms were added.  | Adopted.   |
| PDSA 2                        | Reviewed alarms at weekly ventilator meeting.  | Attendees were aware of changes, but this<br>information was not disseminated to all<br>physicians and staff. | Adapted and sent alarm info in planning meeting update emails.   |
| PDSA 3                        | Sent emails after meeting to all LTMV providers.   | Improved knowledge of potential changes and improvement in our measure.                                       | Abandoned after several months once practice was sustained.  |

DME, durable medical equipment; LTMV, long-term medical ventilator.
